

Translation Use Case

Approve

Author: Mark Hedley

Owner: AVD Team

Version: 1

August 14, 2012

- Primary actor: an approver
- Goal: an approved set of state changes
- Dependencies:
 - propose for approval

Main Success Scenario

To achieve the goal the actor will:

1. Be assigned a ticket for a set of changes of state:
 - the change set will include a number of ‘proposed’ mappings.
2. The approver will analyse the mappings and their change of state.
3. The approver will initiate an ‘Edit’ process:
 - all mappings which the approver agrees with will change state to ‘approved’;
 - all mappings which the approver does not agree with will change state to ‘draft’;
 - no mappings may remain as ‘proposed’;
 - no other edits may take place within this branch.
4. The ticket is updated by the approver with the reasoning behind these state edits.
5. The approver will initiate a ‘Pull Request’ to update the repository with the state changes.
